6.837 Computer Graphics

Bézier Curves and Splines

Wojciech Matusik MIT CSAIL

Before We Begin

- Anything on your mind concerning Assignment 0?
- Any questions about the course?

- Assignment 1 (Curves & Surfaces) will be posted tomorrow
 - Due Wednesday September 26th (8pm)
- Linear algebra review session
 - Monday Sep 17th, 7:00pm-9:00pm in 4-237

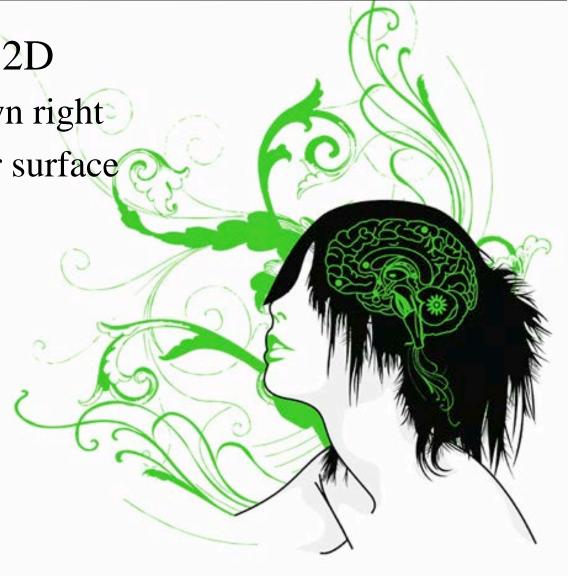

Today

• Smooth curves in 2D

Useful in their own right

Provides basis for surface

editing

Modeling 1D Curves in 2D

Polylines

- Sequence of vertices connected by straight line segments
- Useful, but not for smooth curves
- This is the representation
 that usually gets drawn in the end
 (a curve is converted into a polyline)

Smooth curves

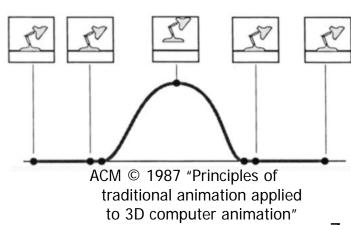

- How do we specify them?
- A little harder (but not too much)

Splines

 A type of smooth curve in 2D/3D

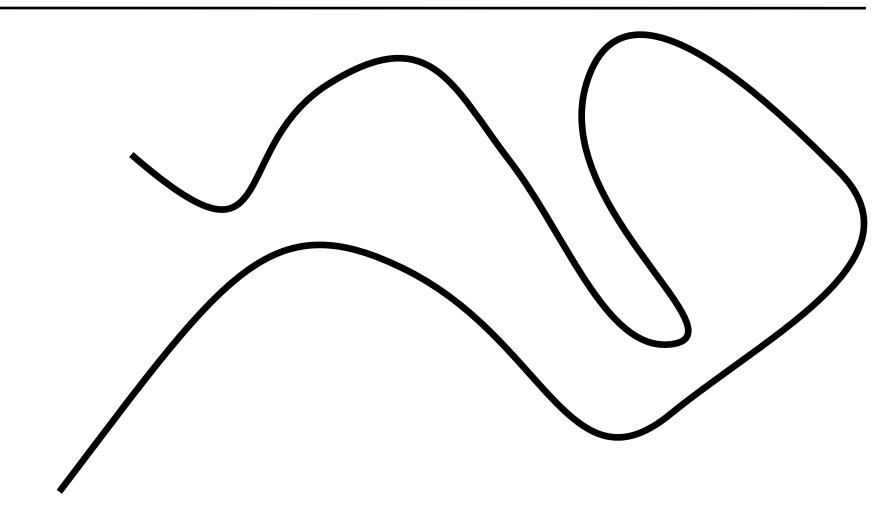

- Many different uses
 - 2D illustration (e.g., Adobe Illustrator)
 - Fonts (e.g., PostScript, TrueType)
 - 3D modeling
 - Animation: trajectories
- In general: interpolation and approximation

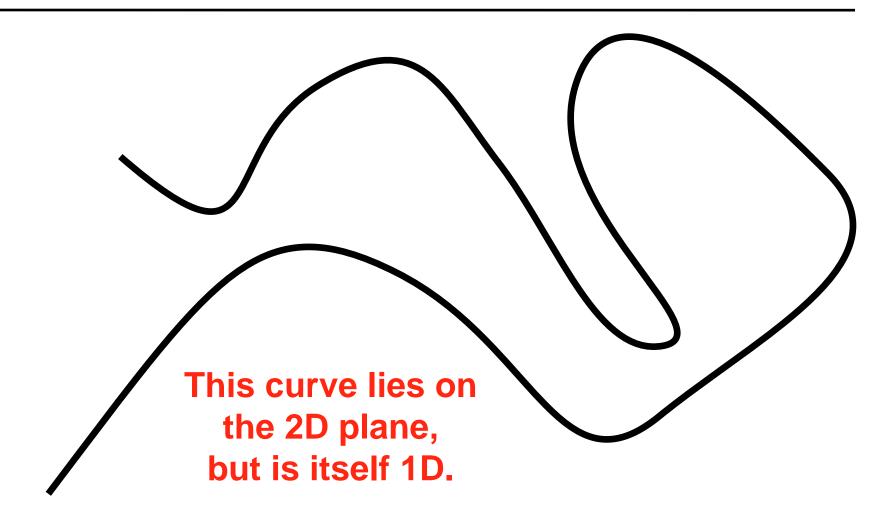

Demo

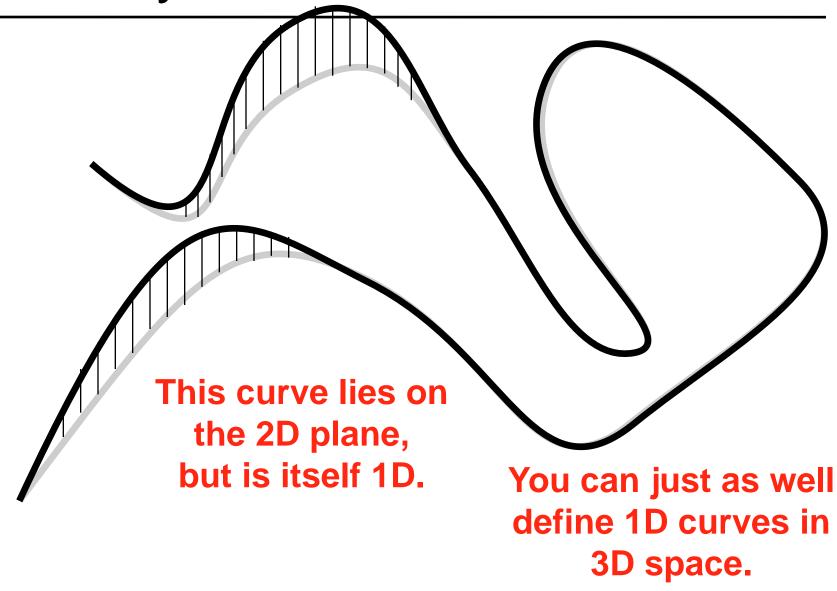

How Many Dimensions?

How Many Dimensions?

How Many Dimensions?

Two Definitions of a Curve

- A continuous 1D set of points in 2D (or 3D)
- A mapping from an interval S onto the plane
 - That is, P(t) is the point of the curve at parameter t

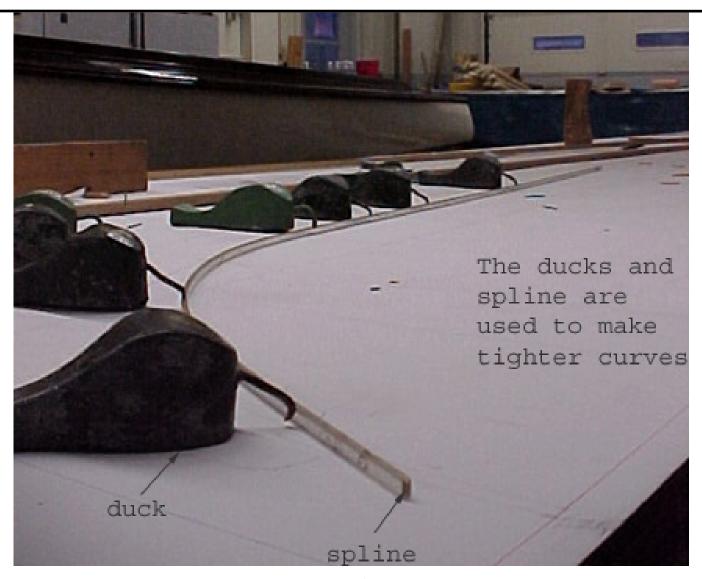

$$P: \mathbb{R} \ni S \mapsto \mathbb{R}^2, \quad P(t) = \begin{pmatrix} x(t) \\ y(t) \end{pmatrix}$$

- Big differences
 - It is easy to generate points on the curve from the 2nd
 - The second definition can describe trajectories, the speed at which we move on the curve

General Principle of Splines

- User specifies control points
- We will interpolate the control points by a smooth curve
 - The curve is completely determined by the control points.

Physical Splines

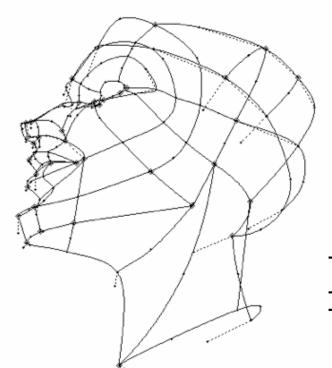

www.abm.org

selshader.com

Two Application Scenarios

- Approximation/interpolation
 - We have "data points", how can we interpolate?
 - Important in many applications
- User interface/modeling
 - What is an easy way to specify a smooth curve?
 - Our main perspective today.

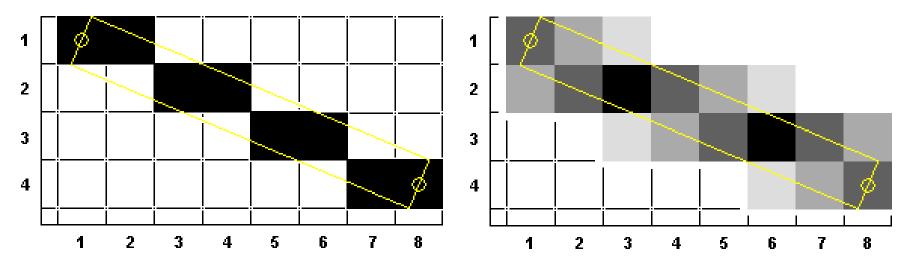

Questions?

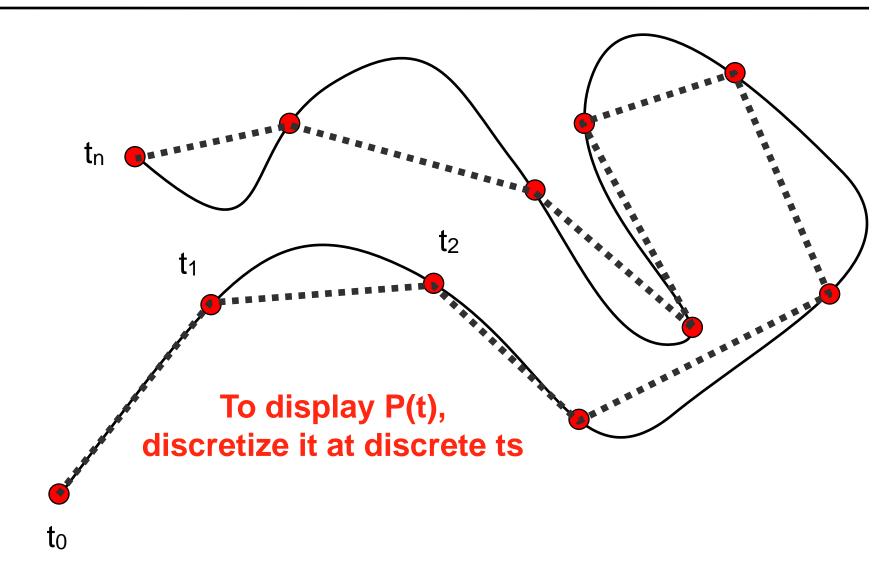

Splines

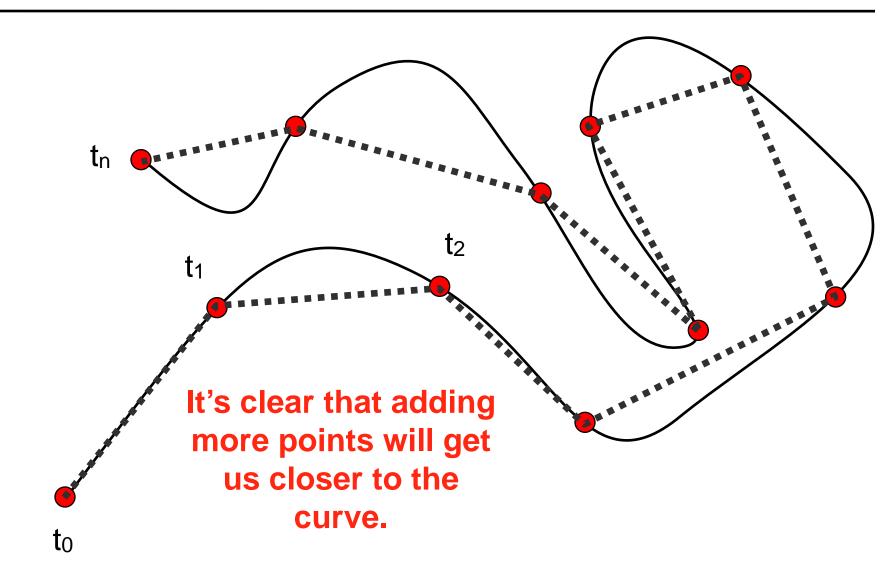

- Specified by a few control points
 - Good for UI
 - Good for storage

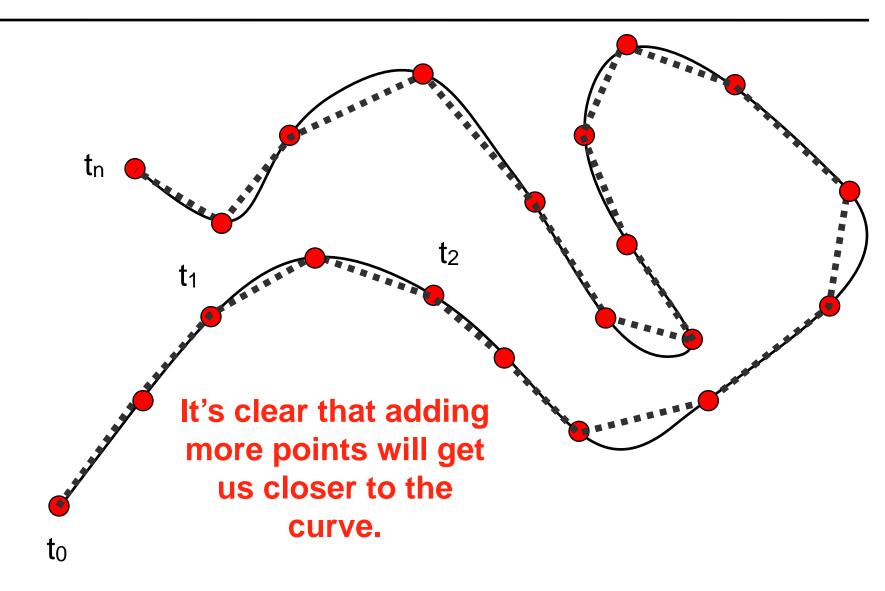

- Results in a smooth parametric curve P(t)
 - Just means that we specify x(t) and y(t)
 - In practice: low-order polynomials, chained together
 - Convenient for animation, where t is time
 - Convenient for tessellation because we can discretize t
 and approximate the curve with a polyline

- It is easy to rasterize mathematical line segments into pixels
 - OpenGL and the graphics hardware can do it for you
- But polynomials and other parametric functions are harder

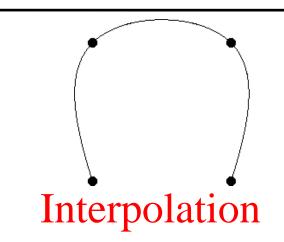

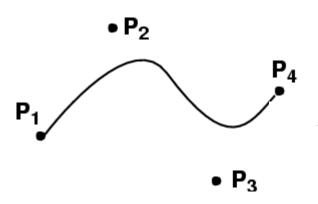

Interpolation vs. Approximation

- Interpolation
 - Goes through all specified points
 - Sounds more logical

- Approximation
 - Does not go through all points

Approximation

Interpolation vs. Approximation

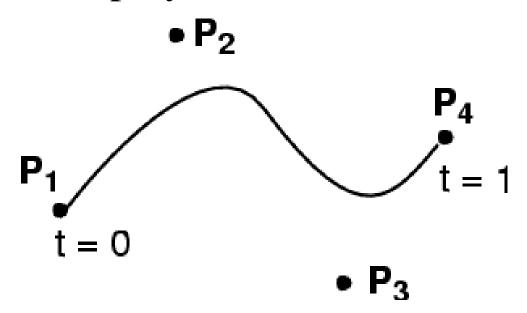

- Interpolation
 - Goes through all specified points
 - Sounds more logical
 - But can be more unstable
 - Interpolation
- Approximation
 - Does not go through all points
 - Turns out to be convenient

 We will do something in between.

Questions?

- User specifies 4 control points **P**₁ ... **P**₄
- Curve goes through (interpolates) the ends P_1 , P_4
- Approximates the two other ones
- Cubic polynomial

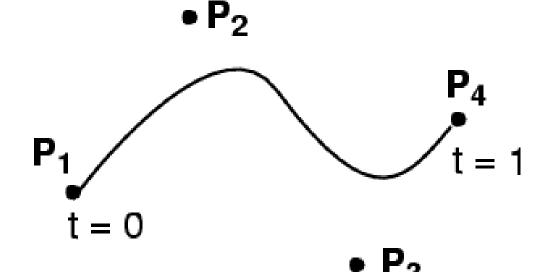

That is,

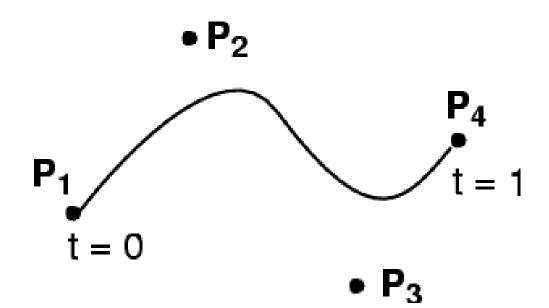

$$x(t) = (1 - t)^{3} x_{1} + 3t(1 - t)^{2} x_{2} + 3t^{2}(1 - t) x_{3} + t^{3} x_{4}$$

$$y(t) = (1 - t)^{3} y_{1} + 3t(1 - t)^{2} y_{2} + 3t^{2}(1 - t) y_{3} + t^{3} x_{4}$$

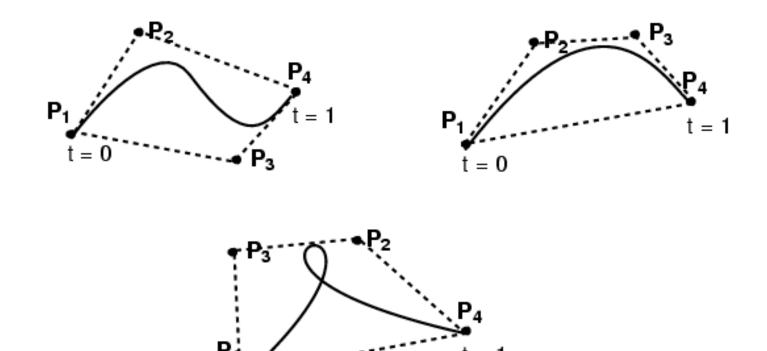

•
$$P(t) = (1-t)^3$$
 P_1
+ $3t(1-t)^2$ P_2
+ $3t^2(1-t)$ P_3
+ t^3 P_4

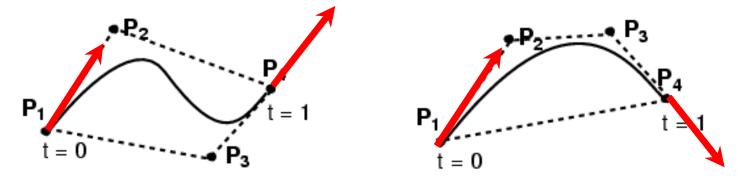

Verify what happens for t=0 and t=1

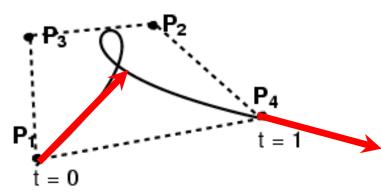

- 4 control points
- Curve passes through first & last control point

- 4 control points
- Curve passes through first & last control point
- Curve is tangent at P_1 to (P_1-P_2) and at P_4 to (P_4-P_3)

A Bézier curve is bounded by the **convex hull** of its control points.

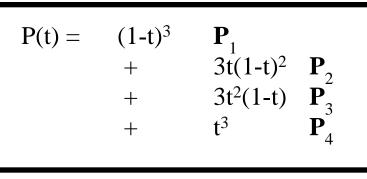

Questions?

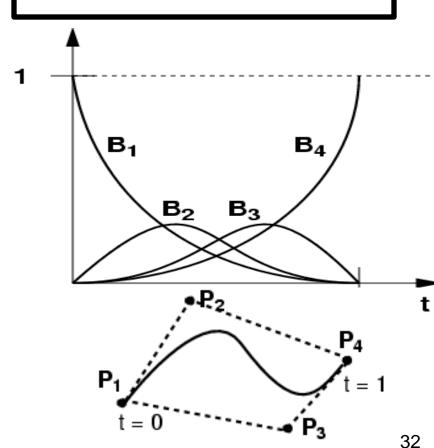

Why Does the Formula Work?

- Explanation 1:
 - Magic!
- Explanation 2:
 - These are smart weights that describe the influence of each control point
- Explanation 3:
 - It is a linear combination of *basis polynomials*.

Weights

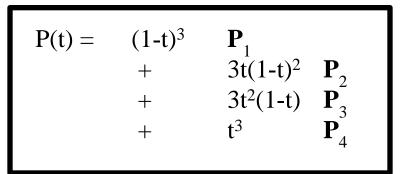

- P(t) is a weighted combination of the 4 control points with weights:
 - $-B_1(t)=(1-t)^3$
 - $-B_2(t)=3t(1-t)^2$
 - $-B_3(t)=3t^2(1-t)$
 - $-B_4(t)=t^3$
- First, P₁ is the most influential point, then P₂, P₃, and P₄

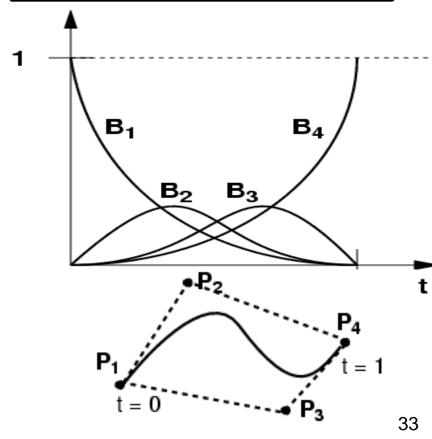

Weights

- P₂ and P₃ never have full influence
 - Not interpolated!

Questions?

Why Does the Formula Work?

- Explanation 1:
 - Magic!
- Explanation 2:
 - These are smart weights that describe the influence of each control point
- Explanation 3:
 - It is a linear combination of *basis polynomials*.
 - The opposite perspective: control points are the weights of polynomials!!!

Why Study Splines as Vector Space?

- Understand relationships between types of splines
 - Conversion
- Express what happens when a spline curve is transformed by an affine transform (rotation, translation, etc.)
- Cool simple example of non-trivial vector space
- Important to understand for advanced methods such as finite elements

Usual Vector Spaces

- In 3D, each vector has three components x, y, z
- But geometrically, each vector is actually the sum

$$v = x\,\vec{i} + y\,\vec{j} + z\,\vec{k}$$

• i, j, k are basis vectors

- Vector addition: just add components
- Scalar multiplication: just multiply components

Polynomials as a Vector Space

- Polynomials $y(t) = a_0 + a_1 t + a_2 t^2 + ... + a_n t^n$
- Can be added: just add the coefficients

$$(y+z)(t) = (a_0 + b_0) + (a_1 + b_1)t +$$

 $(a_2 + b_2)t^2 + \dots + (a_n + b_n)t^n$

• Can be multiplied by a scalar: multiply the coefficients

$$s \cdot y(t) =$$

$$(s \cdot a_0) + (s \cdot a_1)t + (s \cdot a_2)t^2 + \dots + (s \cdot a_n)t^n$$

Polynomials as a Vector Space

• Polynomials $y(t) = a_0 + a_1 t + a_2 t^2 + ... + a_n t^n$

• In the polynomial vector space, $\{1, t, ..., t^n\}$ are the basis vectors, $a_0, a_1, ..., a_n$ are the components

Questions?

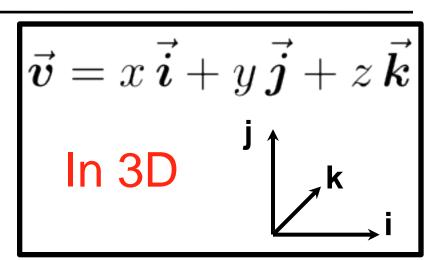

Subset of Polynomials: Cubic

$$y(t) = a_0 + a_1 t + a_2 t^2 + a_3 t^3$$

- Closed under addition & scalar multiplication
 - Means the result is still a cubic polynomial (verify!)
- Cubic polynomials also compose a vector space
 - A 4D **subspace** of the full space of polynomials
- The *x* and *y* coordinates of cubic Bézier curves belong to this subspace as functions of *t*.

Basis for Cubic Polynomials

More precisely: What's a basis?

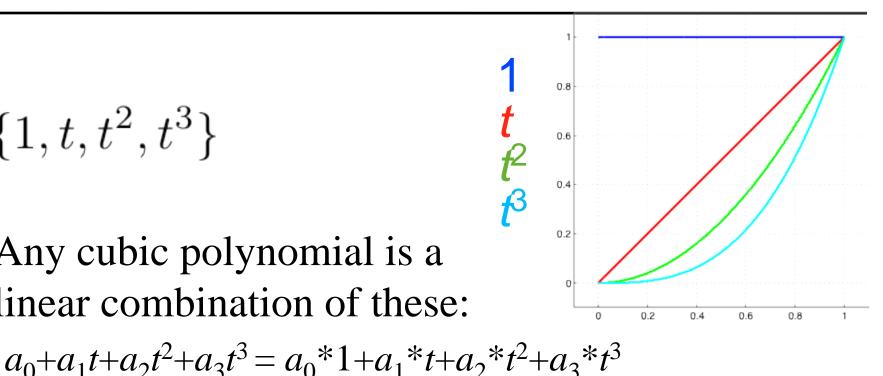

- A set of "atomic" vectors
 - Called basis vectors
 - Linear combinations of basis vectors span the space
 - i.e. any cubic polynomial is a sum of those basis cubics
- Linearly independent
 - Means that no basis vector can be obtained from the others by linear combination
 - Example: i, j, i+j is not a basis (missing k direction!)

Canonical Basis for Cubics

$$\{1, t, t^2, t^3\}$$

 Any cubic polynomial is a linear combination of these:

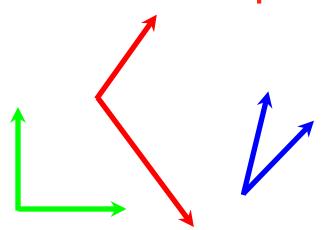

- Means you cannot write any of the four monomials as a linear combination of the others. (You can try.)

Different Basis

• For example:

```
- \{1, 1+t, 1+t+t^2, 1+t-t^2+t^3\}
- \{t^3, t^3+t^2, t^3+t, t^3+1\}
```

2D examples

- These can all be obtained from $1, t, t^2, t^3$ by linear combination
- Infinite number of possibilities, just like you have an infinite number of bases to span R²

Matrix-Vector Notation

• For example:

These relationships hold for each value of *t*

Change-of-basis

"Canonical"

monomial

Matrix-Vector Notation

• For example:

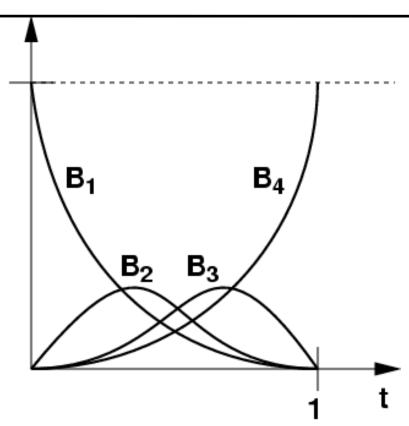

$$\begin{pmatrix} 1 \\ 1+t \\ 1+t+t^2 \\ 1+t-t^2+t^3 \end{pmatrix}$$

$$\begin{pmatrix} 1 \\ 1+t \\ 1+t+t^2 \\ 1+t-t^2+t^3 \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 1 & 1 & 0 & 0 \\ 1 & 1 & 1 & 0 \\ 1 & 1 & -1 & 1 \end{pmatrix} \begin{pmatrix} 1 \\ t \\ t^2 \\ t^3 \end{pmatrix}$$

dependent, i.e., redundant and incomplete.

Bernstein Polynomials

For Bézier curves, the 1
 basis polynomials/vectors
 are Bernstein polynomials

• For cubic Bezier curve:

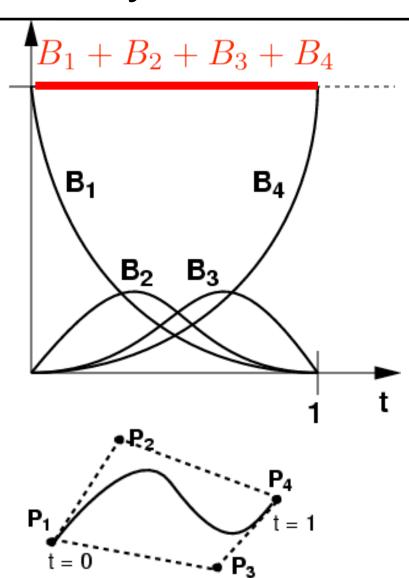

$$B_1(t) = (1-t)^3$$
 $B_2(t) = 3t(1-t)^2$
 $B_3(t) = 3t^2(1-t)$ $B_4(t) = t^3$

(careful with indices, many authors start at 0)

Defined for any degree

Properties of Bernstein Polynomials

- ≥ 0 for all $0 \leq t \leq 1$
- Sum to 1 for every *t*
 - called partition of unity
- These two together are the reason why Bézier curves lie within convex hull
- $B_1(0) = 1$
 - Bezier curve interpolates P₁
- $B_4(1) = 1$
 - Bezier curve interpolates P₄

Bézier Curves in Bernstein Basis

- $P(t) = P_1B_1(t) + P_2B_2(t) + P_3B_3(t) + P_4B_4(t)$ - P_i are 2D points (x_i, y_i)
- P(t) is a linear combination of the control points with weights equal to Bernstein polynomials at t
- But at the same time, the control points (P₁, P₂, P₃, P₄) are the "coordinates" of the curve in the Bernstein basis
 - In this sense, specifying a Bézier curve with control points is exactly like specifying a 2D point with its x and y coordinates.

Two Different Vector Spaces!!!

- The plane where the curve lies, a 2D vector space
- The space of cubic polynomials, a 4D space
- Don't be confused!
- The 2D control points can be replaced by 3D points this yields space curves.
 - The math stays the same, just add z(t).
- The cubic basis can be extended to higher-order polynomials
 - Higher-dimensional vector space
 - More control points

Questions?

Change of Basis

- How do we go from Bernstein basis to the canonical monomial basis
 1, t, t², t³ and back?
 - With a matrix!

•
$$B_1(t)=(1-t)^3$$

•
$$B_2(t)=3t(1-t)^2$$

•
$$B_3(t)=3t^2(1-t)$$

•
$$B_a(t)=t^3$$

$$\begin{pmatrix}
B_1(t) \\
B_2(t) \\
B_3(t) \\
B_4(t)
\end{pmatrix} = \begin{pmatrix}
1 & -3 & 3 & -1 \\
0 & 3 & -6 & 3 \\
0 & 0 & 3 & -3 \\
0 & 0 & 0 & 1
\end{pmatrix} \begin{pmatrix}
1 \\
t \\
t^2 \\
t^3
\end{pmatrix}$$

New basis vectors

How You Get the Matrix

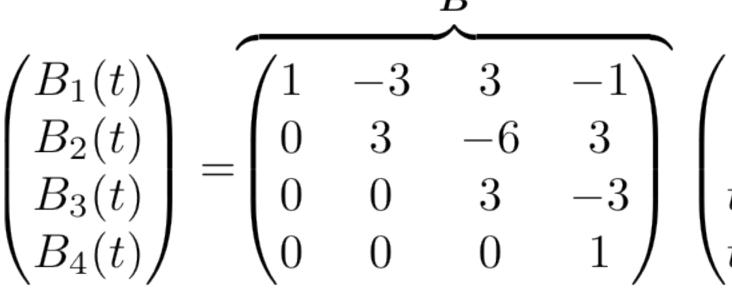

Cubic Bernstein:

- $B_1(t)=(1-t)^3$
- $B_2(t)=3t(1-t)^2$
- $B_3(t)=3t^2(1-t)$
- $B_4(t)=t^3$

Expand these out and collect powers of t.

The coefficients are the entries in the matrix B!

Change of Basis, Other Direction

• Given B1...B4, how to get back to canonical 1, *t*, *t*², *t*³?

$$\begin{pmatrix}
B_1(t) \\
B_2(t) \\
B_3(t) \\
B_4(t)
\end{pmatrix} =
\begin{pmatrix}
1 & -3 & 3 & -1 \\
0 & 3 & -6 & 3 \\
0 & 0 & 3 & -3 \\
0 & 0 & 0 & 1
\end{pmatrix}
\begin{pmatrix}
1 \\
t \\
t^2 \\
t^3
\end{pmatrix}$$

Change of Basis, Other Direction

That's right, with the inverse matrix!

• Given B1...B4, how to get back to canonical 1, *t*, *t*², *t*³?

$$\begin{pmatrix}
1 \\
t \\
t^{2} \\
t^{3}
\end{pmatrix} =
\begin{pmatrix}
1 & 1 & 1 & 1 \\
0 & 1/3 & 2/3 & 1 \\
0 & 0 & 1/3 & 1 \\
0 & 0 & 0 & 1
\end{pmatrix}
\begin{pmatrix}
B_{1}(t) \\
B_{2}(t) \\
B_{3}(t) \\
B_{4}(t)
\end{pmatrix}$$

Recap

- Cubic polynomials form a 4D vector space.
- Bernstein basis is canonical for Bézier.
 - Can be seen as influence function of data points
 - Or data points are coordinates of the curve in the Bernstein basis
- We can change between basis with matrices.

Questions?

More Matrix-Vector Notation

$$P(t) = \sum_{i=1}^{4} P_i \ B_i(t) = \sum_{i=1}^{4} \left[\begin{pmatrix} x_i \\ y_i \end{pmatrix} B_i(t) \right]$$

Bernstein polynomials (4x1 vector)

$$P(t) = \begin{pmatrix} x(t) \\ y(t) \end{pmatrix} = \begin{pmatrix} x_1 & x_2 & x_3 & x_4 \\ y_1 & y_2 & y_3 & y_4 \end{pmatrix} \begin{pmatrix} B_1(t) \\ B_2(t) \\ B_3(t) \\ B_4(t) \end{pmatrix}$$
 point on curve matrix of (2x1 vector) control points (2 x 4)

Flashback

$$\begin{pmatrix}
B_1(t) \\
B_2(t) \\
B_3(t) \\
B_4(t)
\end{pmatrix} =
\begin{pmatrix}
1 & -3 & 3 & -1 \\
0 & 3 & -6 & 3 \\
0 & 0 & 3 & -3 \\
0 & 0 & 0 & 1
\end{pmatrix}
\begin{pmatrix}
1 \\
t \\
t^2 \\
t^3
\end{pmatrix}$$

Cubic Bézier in Matrix Notation

point on curve

$$P(t) = \begin{pmatrix} x(t) \\ y(t) \end{pmatrix} =$$

Canonical monomial basis

$$\begin{pmatrix} x_1 & x_2 & x_3 & x_4 \\ y_1 & y_2 & y_3 & y_4 \end{pmatrix}$$

$$\begin{pmatrix} x_1 & x_2 & x_3 & x_4 \\ y_1 & y_2 & y_3 & y_4 \end{pmatrix} \begin{pmatrix} 1 & -3 & 3 & -1 \\ 0 & 3 & -6 & 3 \\ 0 & 0 & 3 & -3 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 \\ t \\ t^2 \\ t^3 \end{pmatrix}$$
"Geometry matrix"

"Spline matrix" (Bernstein)

General Spline Formulation

$$Q(t) = \mathbf{GBT}(\mathbf{t}) = \text{Geometry } \mathbf{G} \cdot \text{Spline Basis } \mathbf{B} \cdot \text{Power Basis } \mathbf{T(t)}$$

- Geometry: control points coordinates assembled into a matrix $(P_1, P_2, ..., P_{n+1})$
- Spline matrix: defines the type of spline
 - Bernstein for Bézier
- Power basis: the monomials $(1, t, ..., t^n)$
- Advantage of general formulation
 - Compact expression
 - Easy to convert between types of splines
 - Dimensionality (plane or space) does not really matter

Questions?

A Cubic Only Gets You So Far

• What if you want more control?

Higher-Order Bézier Curves

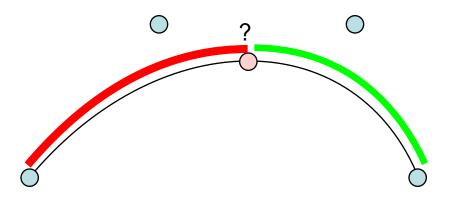

- > 4 control points
- Bernstein Polynomials as the basis functions
 - For polynomial of order n, the i^{th} basis function is

$$B_i^n(t) = \frac{n!}{i!(n-i)!}t^i(1-t)^{n-i}$$

- Every control point affects the entire curve
 - Not simply a local effect
 - More difficult to control for modeling
- You will not need this in this class

Subdivision of a Bezier Curve

- Can we split a Bezier curve in the middle into two Bézier curves?
 - This is useful for adding detail
 - It avoids using nasty higher-order curves

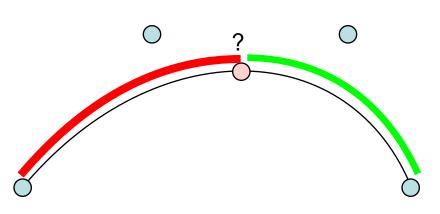

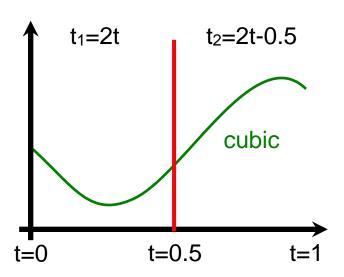

Subdivision of a Bezier Curve

- Can we split a Bezier curve in the middle into two Bézier curves?
 - The resulting curves are again a cubic
 (Why? A cubic in t is also a cubic in 2t)

- Hence it must be representable using the Bernstein

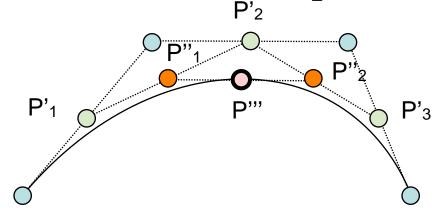

basis. So yes, we can!

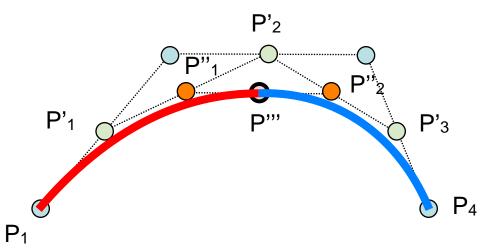

De Casteljau Construction

- Take the middle point of each of the 3 segments
- Construct the two segments joining them
- Take the middle of those two new segments
- Join them
- Take the middle point P'''

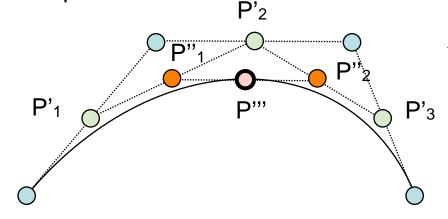

Result of Split in Middle

- The two new curves are defined by
 - P₁, P'₁, P''₁, and P'''
 - P", P"₂, P'₃, and P₄
- Together they exactly replicate the original curve!
 - Originally 4 control points, now 7 (more control)

Sanity Check

- Do we actually get the middle point?
- $B_1(t) = (1-t)^3$
- $B_2(t)=3t(1-t)^2$
- $B_3(t)=3t^2(1-t)$
- $B_{\Delta}(t)=t^3$

$$P'_1 = 0.5(P_1 + P_2)$$

 $P'_2 = 0.5(P_2 + P_3)$
 $P'_3 = 0.5(P_3 + P_4)$

$$P_1'' = 0.5(P_1' + P_2')$$

$$P_2'' = 0.5(P_2' + P_3')$$

$$P''' = 0.5(P''_1 + P''_2)$$

$$= 0.5(0.5(P'_1 + P'_2) + 0.5(P'_2 + P'_3))$$

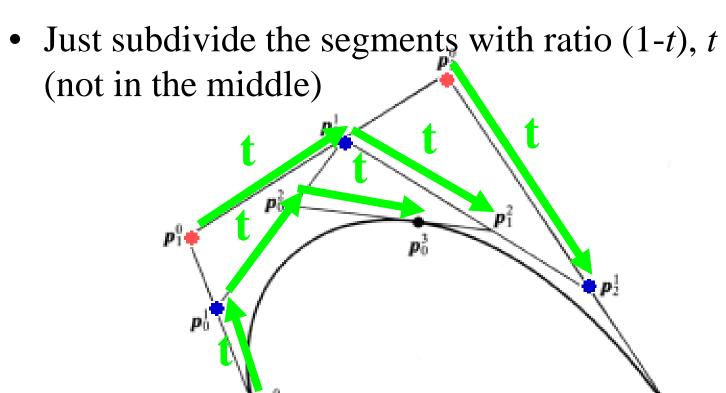

$$= 0.5(0.5[0.5(P_1 + P_2) + 0.5(P_2 + P_3)] + 0.5[0.5(P_2 + P_3) + 0.5(P_3 + P_4)]$$

$$= 1/8P_1 + 3/8P_2 + 3/8P_3 + 1/8P_4$$

De Casteljau Construction

• Actually works to construct a point at any *t*, not just 0.5

Recap

- Bezier curves: piecewise polynomials
- Bernstein polynomials
- Linear combination of basis functions
 - Basis: control points weights: polynomials
 - Basis: polynomials weights: control points
- Subdivision by de Casteljau algorithm
- All linear, matrix algebra
